PROBLEM:

Python Program to display name, college name, and other messages.

SOLUTION:

```
1 def personal_details():
2    name = "Simon"
3    age = 19
4    address = "Bangalore, Karnataka, India"
5
6    print(f"Name: {name}\nAge: {age}\nAddress: {address}")
7
8    personal_details()
```

```
Name: Simon
Age: 19
Address: Bangalore, Karnataka, India
```

Python Program using type() function to display different basic data types in Python.

SOLUTION:

```
1 \quad \text{num} = 3.14
   word = "Hello, World!"
   flag = True
 3
 4
5
   print("Type of num:", type(num))
    print("Type of word:", type(word))
 6
    print("Type of flag:", type(flag))
 7
 8
    my_tuple = (10, 'Hello', 45, 'Hi')
9
    my_dict = {1: 'One', 2: 'Two', 3: 'Three'}
10
11
12 if type(my tuple) is not type(my dict):
        print("The variables have different object types.")
13
14 else:
        print("The variables have the same object type.")
15
```

```
Type of num: <class 'float'>
Type of word: <class 'str'>
Type of flag: <class 'bool'>
The variables have different object types.
```

PROBLEM:

Python Program to input two numbers then find the larger/smaller number.

SOLUTION:

```
Enter the first number: 55
Enter the second number: 53
55.0 is larger than 53.0.
```

Python Program to determine ODD or EVEN number.

SOLUTION:

```
Enter a number: 55
The number 55 is Odd.
```

PROBLEM:

Python Program to print *n* numbers of prime number.

SOLUTION:

```
1 def print_n_primes(n):
        count, num = 0, 2
 2
        while count < n:
 3 -
            if is_prime(num):
 4 -
                print(num, end=" ")
 5
                count += 1
 6
            num += 1
 7
 8 def is_prime(num):
            if num <= 1:
 9 -
10
                return False
11 -
            for i in range(2, int(num**0.5) + 1):
                if num % i == 0:
12 -
13
                    return False
14
            return True
15
    n = int(input("Enter the value of n: "))
16
    print(f"The first {n} prime numbers are:")
17
    print n primes(n)
18
```

```
Enter the value of n: 5
The first 5 prime numbers are:
2 3 5 7 11
```

Python Program to input three numbers and find the largest and smallest number.

SOLUTION:

```
def find_largest_and_smallest(num1, num2, num3):
    largest = max(num1, num2, num3)
    smallest = min(num1, num2, num3)
    return largest, smallest

num1 = float(input("Enter the first number: "))
num2 = float(input("Enter the second number: "))
num3 = float(input("Enter the third number: "))

largest_num, smallest_num = find_largest_and_smallest(num1, num2, num3)

print(f"The largest number is {largest_num}.")

print(f"The smallest number is {smallest_num}.")
```

```
Enter the first number: 59
Enter the second number: 69
Enter the third number: 79
The largest number is 79.0.
The smallest number is 59.0.
```

PROBLEM:

Python Program to determine Armstrong number

SOLUTION:

```
Enter a number: 152
152 is not an Armstrong number.
```

Python Program to determine palindrome number.

SOLUTION:

```
1 def is palindrome(number):
       num_str = str(number)
2
        return num str == num str[::-1]
3
4
5
   user_input = int(input("Enter a number: "))
6 if user_input < 0:</pre>
7
       print("Please enter a non-negative integer.")
8 elif is_palindrome(user_input):
       print(f"{user_input} is a palindrome number.")
9
10 else:
       print(f"{user_input} is not a palindrome number.")
11
```

```
Enter a number: 123321
123321 is a palindrome number.
```

Python Program to reverse words in a given String in Python.

SOLUTION:

```
1 def reverse_words(input_string):
       words = input_string.split()
2
3
        reversed_words = words[::-1]
4
        reversed_string = ' '.join(reversed_words)
5
       return reversed string
6
7
   input string = "Hello World"
8
   reversed_string = reverse_words(input_string)
9
   print("Original String:", input_string)
10
   print("Reversed Words String:", reversed_string)
11
```

```
Original String: Hello World
Reversed Words String: World Hello
```

PROBLEM:

Python Program using 5 string function in python.

SOLUTION:

```
1 def string functions demo(input string):
        words = input_string.split()
2
        print("Split String into Words:", words)
3
4
        joined_string = '-'.join(words)
5
        print("Joined String with Hyphens:", joined_string)
6
7
        replaced_string = input_string.replace('World', 'Universe')
8
        print("String after Replacement:", replaced_string)
9
10
        upper string = input string.upper()
11
        print("Uppercase String:", upper string)
12
13
14
15
    input_string = " Hello World "
16
17 string functions demo(input string)
```

```
Split String into Words: ['Hello', 'World']
Joined String with Hyphens: Hello-World
String after Replacement: Hello Universe
Uppercase String: HELLO WORLD
```

Python Program to display the terms of a Fibonacci series.

SOLUTION:

```
1 def fibonacci_series(n):
2    a, b = 0, 1
3
4    for i in range(n):
5        print(a, end=" ")
6        a, b = b, a + b
7
8    num_of_terms = 10
9    print(f"Fibonacci series up to {num_of_terms} terms:")
10 fibonacci_series(num_of_terms)
```

```
Fibonacci series up to 10 terms:
0 1 1 2 3 5 8 13 21 34
```

PROBLEM:

Python Program to find largest & smallest number in a tuple.

SOLUTION:

```
1 def find_largest_and_smallest(numbers):
2    largest = max(numbers)
3    smallest = min(numbers)
4    return largest, smallest
5
6 # Example usage
7 numbers = (3, 41, 52, 26, 38, 57, 9, 49)
8 largest, smallest = find_largest_and_smallest(numbers)
9 print("Largest number:", largest)
10 print("Smallest number:", smallest)
```

```
Largest number: 57
Smallest number: 3
```

Python Program to find largest & smallest number in a list

SOLUTION:

```
1 def find_largest_and_smallest(numbers):
        largest = numbers[0]
        smallest = numbers[0]
 3
 4
      for number in numbers:
 5 -
 6 -
            if number > largest:
7
                largest = number
            if number < smallest:</pre>
 8 -
                smallest = number
 9
10
11
        return largest, smallest
12
    numbers = [3, 41, 52, 26, 38, 57, 9, 49]
13
    largest, smallest = find_largest_and_smallest(numbers)
14
   print("Largest number:", largest)
15
   print("Smallest number:", smallest)
16
```

```
Largest number: 57
Smallest number: 3
```

PROBLEM:

Python Program to Sort Python Dictionaries by Key or Value.

SOLUTION:

```
myDict = {'ravi': 10, 'rajnish': 9,
 1
             'sanjeev': 15, 'yash': 2, 'suraj': 32}
 2
 3
    myKeys = list(myDict.keys())
 4
   myValue = list(myDict.items())
 5
    myValue.sort(key=lambda item: item[1])
 6
    myKeys.sort()
    sorted dict key = {i: myDict[i] for i in myKeys}
    sorted dict value = \{i[0]: i[1] \text{ for } i \text{ in myValue}\}
10
    print(sorted dict key)
11
    print(sorted dict value)
12
```

```
{'rajnish': 9, 'ravi': 10, 'sanjeev': 15, 'suraj': 32, 'yash': 2} {'yash': 2, 'rajnish': 9, 'ravi': 10, 'sanjeev': 15, 'suraj': 32}
```

Python Program to Merging two Dictionaries.

SOLUTION:

```
1 def merge_dicts(dict1, dict2):
2    merged_dict = dict1.copy()
3    merged_dict.update(dict2)
4    return merged_dict
5
6 # Example usage
7 dict1 = {'a': 1, 'b': 2}
8 dict2 = {'c': 3, 'd': 4}
9 merged_dict = merge_dicts(dict1, dict2)
10 print("Merged Dictionary:", merged_dict)
```

```
Merged Dictionary: {'a': 1, 'b': 2, 'c': 3, 'd': 4}
```

PROBLEM:

Python Program to perform guess the number generated by Random function.

SOLUTION:

```
import random
 2
   def guess_the_number():
        secret_number = random.randint(1, 100)
        print("I have chosen a number between 1 and 100. Can you guess it?")
8
        attempts = 0
        while True:
9
            guess = int(input("Enter your guess (between 1 and 100): "))
10
11
